## 1.0 INTRODUCTION

Binak oilfield in Bushehr province is a part of the southern oilfields of Iran, is located 20 km northwest of Genaveh city.

With the aim of increasing production of oil from Binak oilfield, an EPC/EPD Project has been defined by NIOC/NISOC and awarded to Petro Iran Development Company (PEDCO). Also PEDCO (as General Contractor) has assigned the EPC-packages of the Project to "Hirgan Energy - Design and Inspection" JV.

As a part of the Project, construction of well location, access road, wellhead facilities for W007S shall be done. In addition, construction of new flowline from aforementioned well location to Binak B/C unit is in the Project scope of work.

## GENERAL DEFINITION

The following terms shall be used in this document.

|                              |  |
|------------------------------|--|
| CLIENT:                      | National Iranian South Oilfields Company (NISOC)   |
| PROJECT:                     | Binak Oilfield Development – Construction of Well Location, Wellhead Facilities & Flowline for W007S               |
| EPD/EPC CONTRACTOR (GC):     | Petro Iran Development Company (PEDCO)   |
| EPC CONTRACTOR:              | Joint Venture of : Hirgan Energy – Design & Inspection(D&I) Companies  |
| VENDOR:                      | The firm or person who will fabricate the equipment or material.   |
| EXECUTOR:                    | Executor is the party which carries out all or part of construction and/or commissioning for the project.          |
| THIRD PARTY INSPECTOR (TPI): | The firm appointed by EPD/EPC CONTRACTOR (GC) and approved by CLIENT (in writing) for the inspection of goods.     |
| SHALL:                       | Is used where a provision is mandatory.  |
| SHOULD:                      | Is used where a provision is advisory only.  |
| WILL:                        | Is normally used in connection with the action by CLIENT rather than by an EPC/EPD CONTRACTOR, supplier or VENDOR. |
| MAY:                         | Is used where a provision is completely discretionary.   |

document and other project documents or reference standards, this issue must be reported to the CLIENT. The final decision in this situation will be made by CLIENT.

## 4.0 PROCESS DESCRIPTION

With the aim of increasing the oil production rate from BINAK field, the construction of flow lines and wellhead facilities has been on the agenda. Therefore, National Iranian South Oil Company has intends to establish the project of "Construction of flow lines and wellhead Facilities for BINAK Oil Field ". The most important activities and facilities needed for the project are as follows:

- Construction of 6 wells with 6 wellhead facilities series (class 5000 for wellhead facilities & class 3000 for flow lines)
- Construction of 6 flow lines with construction and installation of supports with all necessary facilities for pipelines and connecting lines to the manifold in BINAK Cluster unit.
- Design, Construction & Extension of existing manifold for Connecting new 8 flow lines (which 2 connections will be considered for future)

## 5.0 SIMULATION METHODOLOGY

### 5.1 SIMULATION SOFTWARE

Following process software will be used in this project as per requirements:

- ASPEN HYSYS V.11
- OLGA 2017
- PVT SIM 2011

Aspen HYSYS is normally used for process simulation as main modelling software, which shall utilize the Peng-Robinson equation of state.

Olga software is used for flowlines hydraulic calculation; this software allows calculation of flowline size, flow regimes, and pressure drop.

### 5.2 ASSUMPTIONS

Table 5-2.1: Assumption of calculation

| FLOWLINE                    | Size | Material | Thickness (mm) | Roughness (mm) |
|-----------------------------|------|----------|----------------|----------------|
| FLOWLINE FOR W007S WELLHEAD | 6"   | C.S.     | 7.9            | 0.0457         |

شماره صفحه : 17 از 17

### 5.3 PIPELINE SIZING CRITERIA FOR TWO PHASE

Lines transporting gas and liquid in two phase flow should be sized primarily on the basis of flow velocity. Flow velocity should be kept at least below fluid erosional velocity (the erosion velocity must be <1). If solid (sand) production is anticipated fluid velocity should be reduced accordingly. The velocity above which erosion may occur can be determined by the following empirical equation:

$$Ve = \frac{1.22 * C}{\sqrt{\rho m}}$$

Where:

**Ve** = fluid erosional velocity, m/s

**C** = empirical constant, to be considered as 125 for non-continuous operation  
And 100 for continuous operation

**ρm** = gas/liquid mixture density at flowing pressure and temperature, kg/m<sup>3</sup>

The mixture density is determined from the **HYSYS** simulation program.

## 6.0 DESIGN BASIS

### 6.1 FLUID COMPOSITION

Dry basis composition of the incoming fluid is given in following tables:

Table 6-1.1: W007S (Bangestan) Crude Oil Composition

| Reservoir Oil Component | Bangestan (%MOLE ) |
|-------------------------|--------------------|
| H2S                     | 0.32               |
| Nitrogen                | 0.06               |
| CO2                     | 1.77               |
| Methane                 | 28.14              |
| Ethane                  | 9.74               |
| Propane                 | 7.78               |
| i-Butane                | 1.47               |
| n-Butane                | 4.16               |
| i-Pentane               | 1.36               |
| n-Pentane               | 1.36               |

Max GOR of BANGESTAN: 496 SCF/STB

## 6.2 WATER CUT

Volume percentage of formation water in crude oil is considered as following table:

Table 6-2.1: Water Cut

| Crude Oil | Volume Percent (%) |
|-----------|--------------------|
| Bangestan | 0~40               |

## 6.3 FLUID PROPERTIES

The maximum and minimum amount of oil produced from the W007S (Bangestan) well is provided in the following table:

Table 6-3.1: W007S (Bangestan) Wellhead Condition

| WELL NO. | Minimum flow rate for well (bbl/day) | Maximum flow rate for well (bbl/day) |
|----------|--------------------------------------|--------------------------------------|
| W046S    | 500                                  | 1000                                 |

## 6.4 TEMPERATURE OF WELLHEAD & DESTINATION PRESSURE

The outlet fluid temperature from the W007S (Bangestan) well and the pressure at the flowline destination is considered in accordance with the following table:

Table 6-4.1: Temperature of Wellhead & Destination Pressure

نگهداری و افزایش تولید میدان نفتی بینک  
فعالیت های رو زمینی در بسته های کاری تحت الارض

|-------|-----------|------------|---------|------|----------|-------|------|
| BK    | W007S     | PEDCO      | 110     | PR   | RT       | 0001  | D05  |

شماره صفحه : 12 از 17

Curve 7-2.3: EVR of 6" Bangestan Flowlines in Summer & Winter (MIN-FLOW)

## Conclusions

- The above diagram shows the variations of gas velocity inside flowlines. It is obvious that at the beginning of flow line after passing choke valve, manifold and main pipeline the gas velocity increases to about 0.45 m/s due to change in flow characteristics.

## ➤ FLOW REGIME CURVES

Curve 7-2.4: Flow Regime of W007 Bangestan Flowline (MAX-FLOW)

شماره پیمان:  
053 - 073 - 9184
